

Problem S7 – Image Gallery Browser

Difficulty: ★★☆☆ Beginner+

Overview

A photo gallery application stores a collection of image names. Instead of displaying all images at once, the gallery shows 4 images per page. The user can navigate through the gallery using simple navigation buttons.

Your task is to build an Image Gallery Browser using Python and list slicing.

Requirements

1. Create a list containing 20 image names.

Example:

```
images = [  
    "Image 1", "Image 2", "Image 3", "Image 4", "Image 5",  
    "Image 6", "Image 7", "Image 8", "Image 9", "Image 10",  
    "Image 11", "Image 12", "Image 13", "Image 14", "Image 15",  
    "Image 16", "Image 17", "Image 18", "Image 19", "Image 20"  
]
```

Display

Show 4 images per page.

Example:

Page 1

Image 1

Image 2

Image 3

Image 4

Page 2

Image 5

Image 6

Image 7

Image 8

Navigation Buttons

Provide the following buttons:

-  First Page
-  Previous
-  Next
-  Last Page

The buttons should update the displayed page accordingly.

Rules

- Each page must display exactly 4 images (except the last page if fewer images remain).
- Do not allow navigation before the first page.
- Do not allow navigation after the last page.
- Use list slicing to select the images for the current page.
- **Important Requirement**
 -  Do not use loops to choose which images belong to a page.
 -  Use list slicing to retrieve the images for the current page.
